

IBSuite - Secure and Compliant by Design

IBSuite is “**Security by Design**” – from the start and from the heart of all our design:

- deployed in the same version for all customers regardless of type of business/country etc.;
- country specific components are fitted on top of IBSuite as extensions / plugins - utilizing the IBSuite documented APIs - including customer specific extensions;
- there is no access to the underlying database of IBSuite - all extensions / customizations therefore have to go through documented APIs and services;
- we are ensuring backwards compatibility

What does that mean?

This also means that:

- access to underlying database is restricted by design;
- data may not be changed directly in the database – all access goes through proper APIs;
- transactions are “final” once written, hence not changeable;
- deletion of transactional data is not supported but IBSuite marks records to be “deleted” as closed;
- all changes to objects/entities and their properties are logged;
- segregation of duty by roles and permissions
